LAB 5: STATIC CODE ANALYSIS

Student Attendance Tracker

Name	Reia S
SRN	PES2UG24CS921
GitHub repository	https://github.com/ReiaSen/Lab5_attendance-tracker_cs921

Objective

To inspect the Python attendance tracker using three static-analysis tools: Pylint, Flake8, and Bandit. Results below are summarized from the terminal screenshots provided.

1. Pylint

Purpose: checks code quality, naming conventions, documentation, and possible errors.

```
Module: attendance_tracker
C0114: Missing module docstring
E0401: Unable to import 'requests' (import-error)
C0103: Several function names do not follow snake_case
W0613: Unused arguments 'version' and 'shell'
C0116: Missing function or method docstring
Reported code rating: 8.24/10
```

Interpretation: Pylint reported documentation and naming-style issues, an import-resolution warning for requests, and unused arguments. Displayed rating: 8.24/10.

2. Flake8

Purpose: checks Python formatting and style rules.

```
attendance_tracker.py:14:1: E302 expected 2 blank lines, found 1
```

Interpretation: Flake8 reported one spacing/style issue: two blank lines were expected before the function definition.

3. Bandit

Purpose: scans Python code for common security-related issues.

```
Python version reported: 3.9.6
Code scanned: 181 lines
Test results: No issues identified.
Total issues: Undefined 0, Low 0, Medium 0, High 0
```

Interpretation: Bandit did not identify security issues in this scan of 181 lines.

Conclusion

Pylint identified documentation, naming, import, and unused-argument findings; Flake8 reported a blank-line formatting issue; Bandit reported no security issues. These results document the scan as run and do not imply that every finding has been fixed.

Note: This is a concise summary of the actual outputs visible in the supplied screenshots.
